Arista Networks (NYSE: ANET)

Equity Research & Scenario-Based DCF Valuation

Ya-Cheng Hsieh (Erica Hsieh) | Research date: November 8, 2026

INTEGRATED RESEARCH v2 • NOT RATED • NO PRICE TARGET

Executive summary

Arista combines accelerating revenue growth with substantial operating profitability. Reported FY2025 revenue grew 28.6% to 9,005.7; unaudited 9M2026 revenue rose 44.3% YoY to 9,402.3. The central research question is whether AI/cloud networking demand and operating leverage can sustain cash generation through customer spending cycles and rising investment requirements. Growth rates are analyst-derived from reported amounts. [K, Item 8 p.69; Q, Part I Item 1 p.2]

Financial highlights — nine months ended September 30

Metric	9M2026	YoY change
Revenue	9,402.3	+44.3%
Operating income	4,178.2	+48.0%
Gross margin	62.9%	-1.6 pp
Operating margin	44.4%	+1.1 pp
Operating cash flow (OCF)	3,977.4	+27.9%

Amounts are reported USD millions; margins and YoY changes are analyst-derived from unrounded figures. All comparisons above match 9M2026 with 9M2025. Operating-expense leverage offset gross-margin pressure, but OCF growth lagged revenue growth. This is a cash-conversion question, not evidence of a permanent deterioration. [Q, Item 1 pp.2,5; Item 2 pp.16,18–19]

Research view and valuation status

The preliminary case rests on AI networking demand, software-led repeat purchasing and operating leverage. The counter-case is concentrated customer spending, competitive pricing and working-capital absorption. Hypotheses and counterarguments appear on page 5; monitoring tests and rating discipline appear on page 9. [K, Item 1 pp.1–9; Q, Item 2 pp.14–19]

Base/Bull/Bear FCFF DCF scenarios and sensitivity analysis are implemented (page 7). All scenario valuations are HYPOTHETICAL / NOT YET VALIDATED. Enterprise value represents operating assets, not equity value or market capitalization. Equity/per-share values and the twelve-month target remain BLOCKED by incomplete bridge, dilution and economic inputs; page 10 explains the precise gaps. No rating, target or upside/downside is assigned. [R1–R2; U]

Reference price, dates and evidence

Reference close: USD 170.80/share on November 6, 2026, corroborated in two vendor historical tables. This observable price is available; it does not resolve the inputs required for a defensible target. The research date is November 8, 2026 (US Eastern). [M; U]

The DCF uses a retrospective September 30, 2026 reference date with the 10-Q filed November 4; it is not a contemporaneously investable September backtest. Reported = SEC fact; management statement = issuer explanation; derived = analyst arithmetic; hypothetical = unvalidated assumption. USD millions unless otherwise labeled; FY ends December 31, Q3 is July–September, and 9M is January–September YTD. Sources are linked on page 10. [R1–R2]

Business, demand and competition

Revenue model and customer groups

Reported: FY2025 product revenue was 7,576.9 and service revenue was 1,428.8. Management describes products as switching/routing systems and associated network applications, while services primarily reflect post-contract support and renewals. Service revenue is not automatically standalone software subscriptions or annual recurring revenue. [K, Item 7 “Revenue” p.54; Item 8 p.69]

Management identifies large cloud/AI operators, internet/service providers, AI neoclouds, enterprises and government customers. Distribution includes direct sales and distributors, resellers, systems integrators and OEM partners. These are issuer descriptions, not independent estimates of customer economics. [K, Item 1 “Our Customers” / “Sales and Marketing” p.7]

Products and the role of software

Management describes EOS as its network operating system, CloudVision as its management/automation platform and NetDL as its network data lake. Its portfolio includes data-center/AI Ethernet switching, campus networking, routing and support; Etherlink addresses AI networking use cases. A common software and management architecture is an asserted differentiator; independent customer evidence is needed to establish superior operating economics. [K, Item 1 pp.1–4,6]

AI networking: a demand thesis, not a revenue attribution

Management links demand to AI/cloud workloads and discusses scale-up, scale-out and scale-across architectures. AI infrastructure can require networking capacity, but deployment architecture, acceptance conditions and customer budgets govern which vendors capture revenue. Management also cautions that AI investment can change other spending priorities. No AI-specific revenue amount, market size or market-share estimate is asserted. [K, Item 1 pp.2–3; Q, Item 2 “Overview” pp.14–15]

Issuer disclosure	Research implication / qualification
Cisco: competing portfolios and bundled solutions. [K, Item 1 pp.8–9]	Test operating simplicity against procurement breadth; no relative price/performance ranking is established.
NVIDIA: Ethernet, InfiniBand and NVLink interconnect/switch platforms. [N, Item 1 “Data Center” p.5]	Architecture coverage is not proof of vendor selection. NVIDIA and ANET fiscal years are not aligned for peer financial comparisons.
Arista: common software architecture and merchant silicon. [K, Item 1 pp.6–8]	Test retention, costs and pricing against independent customer evidence.

Analyst interpretation and evidence required

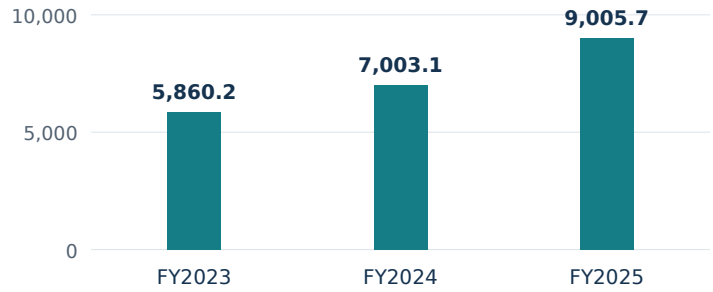

Ethernet adoption alone does not establish an Arista win. Evaluate like-for-like scale-up, scale-out and inter-site requirements, customer procurement constraints and implementation costs. The report does not rank price/performance, claim technology superiority or assign a valuation premium for AI exposure. Independent deployment economics, renewal data and dated customer-spending evidence remain research gaps. [R3, Sections 2–3 and evidence gaps]

Historical financial performance

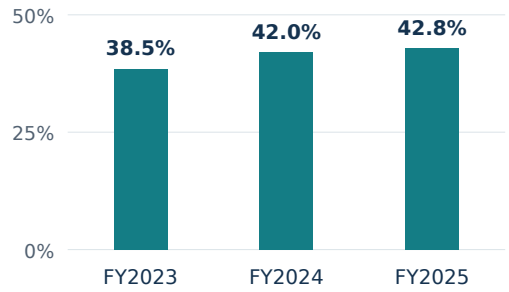

Reported statement amounts; unaudited interim results. Derived growth and margins use unrounded repository inputs. Annual and interim durations remain separate. [K, Item 8 p.69; Q, Part I Item 1 p.2]

USD millions	FY2023	FY2024	FY2025
Revenue	5,860.2	7,003.1	9,005.7
Gross profit	3,630.3	4,491.3	5,768.7
Operating income	2,257.3	2,944.6	3,856.1
Net income	2,087.3	2,852.1	3,511.4

Reported revenue | USD millions

Derived operating margin | %

Derived: revenue grew 19.5% in FY2024 and 28.6% in FY2025. Operating margin increased from 38.5% in FY2023 to 42.8% in FY2025. These are observations, not estimates of sustainable margins. [K p.69; calculations: revenue/prior revenue − 1; operating income/revenue]

USD millions	Q3 2025	Q3 2026	9M 2025	9M 2026
Revenue	2,308.3	3,657.6	6,517.9	9,402.3
Gross profit	1,490.2	2,325.7	4,204.9	5,912.8
Operating income	978.2	1,642.4	2,823.2	4,178.2
Net income	853.0	1,560.4	2,555.6	3,796.2
Diluted EPS (USD)	0.67	1.22	2.00	2.98

Derived: Q3 revenue grew 58.5% YoY; 9M revenue grew 44.3%. The 9M gross margin fell from 64.5% to 62.9%, while operating income grew 48.0%. Management attributes gross-margin pressure to higher product costs, partly offset by supply-chain productivity. Analyst interpretation: OpEx leverage has supported earnings, but cost/mix sensitivity limits simple extrapolation. [Q, Item 1 p.2; Item 2 p.16]

Derived TTM income, October 1, 2025–September 30, 2026: revenue 11,890.1; operating income 5,211.1; net income 4,752.0. Formula: FY2025 + 9M2026 − 9M2025. These are additive income measures, not annualized Q3 results. No TTM diluted EPS or TTM FCF is presented. [K p.69; Q p.2; R4]

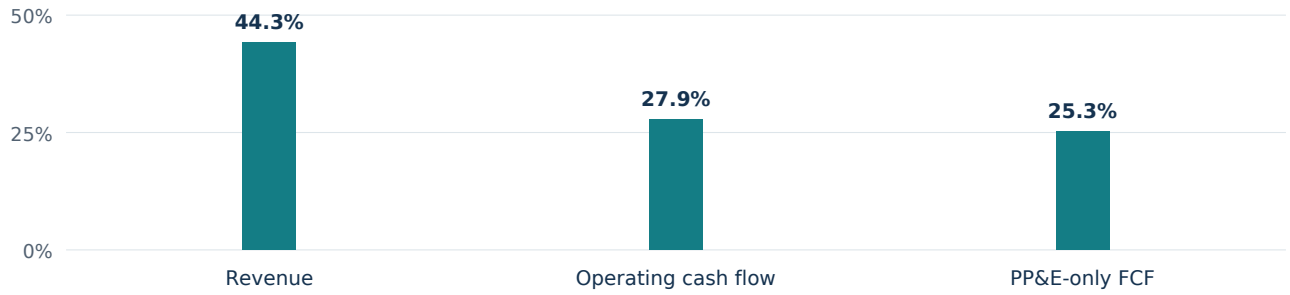

Cash conversion and principal risks

Cash generation: preserve the purchase definitions

FCF below is analyst-derived: operating cash flow less the absolute purchase outflow. These measures are not FCFF and are not SEC-reported FCF line items. Annual purchases include property, equipment AND intangibles; interim purchases are PP&E-only. [K, Item 8 p.72 / local PDF p.76; Q, Item 1 p.5]

Period	Reported OCF	Purchases	Derived FCF	Purchase scope
FY2023	2,034.0	(34.4)	1,999.6	Combined
FY2024	3,708.2	(32.0)	3,676.2	Combined
FY2025	4,371.9	(119.5)	4,252.4	Combined
9M 2025 YTD	3,110.0	(82.5)	3,027.5	PP&E only
9M 2026 YTD	3,977.4	(184.9)	3,792.5	PP&E only

9M2026 YoY growth | analyst-derived, %

Derived: 9M2026 OCF grew 27.9% versus revenue growth of 44.3%. Working-capital movements and customer acceptance affect timing; this comparison does not isolate normalized FCFF conversion. Cash flows are 9M YTD, not standalone Q3. The missing annual cash-intangible split prevents a consistent TTM FCF calculation. [Q pp.2,5,18–19; R1–R2]

Risk assessment and monitoring priorities

Customer concentration / spending: the two largest end customers represented 26% and 16% of FY2025 revenue; identities are not inferred. Large-customer spending and acceptance cycles can create volatility. Monitor diversification and accepted deployments rather than treating AI demand as assured revenue. [K, Item 1 p.7; Item 1A pp.14–15]

Competition / margins: pricing, bundled alternatives, product/customer mix and component costs can pressure profitability. Customers' own solutions and alternative architectures are relevant. Monitor gross margin alongside growth rather than assuming software differentiation protects pricing. [K, Item 1 pp.8–9; Q, Item 2 p.16; Item 1A pp.29–30]

Supply chain / cash conversion: management describes reliance on contract manufacturers and Broadcom silicon, supplier shortages and excess inventory exposure. Receivables, inventory and deferred revenue affect cash timing. Examine commitments and operating cash-flow reconciliation alongside earnings. [K, Item 1 p.8; Q, Item 1 p.5; Item 1A pp.23–26]

Valuation risk: unvalidated discount rates, terminal reinvestment, NWC classification and dilution can dominate the model. Operating success alone does not establish attractive equity value. [R1–R2]

Preliminary hypotheses and forecast drivers

These are analyst hypotheses to investigate, not final investment conclusions. Evidence is a starting point, not confirmation. [R3, Section 3]

Preliminary hypothesis	Evidence / counterargument
1. AI networking could sustain demand.	Management describes AI/cloud networking demand [K pp.2–3; Q pp.14–15]. Counterargument: acceptance delays, spending reprioritization or competing architectures may limit conversion. Test deployment schedules and repeat purchases.
2. Software consistency could support repeat purchasing.	EOS / CloudVision platform descriptions provide a starting point [K pp.1–6]. Counterargument: bundled competition or limited proven cost benefit may weaken differentiation. Test independent customer economics and renewals.
3. Scale could support operating leverage.	Historical operating income rose [K p.69; Q p.2]. Counterargument: gross-margin pressure and reinvestment/NWC absorption can offset scale. Test normalized cash conversion, not earnings alone.

Scenario inputs: HYPOTHETICAL / NOT YET VALIDATED

The cases are illustrative, not management guidance, probabilities or empirically calibrated forecasts. Q4 gross margin and OpEx ratios apply to Q4 FY2026, then full FY2027–FY2030; FY2026 full-year ratios blend reported 9M with modeled Q4. All drivers below come from existing assumptions, not new estimates. [R1; data/valuation/assumptions.json]

Driver	Base	Bull	Bear
Q4 FY2026 revenue YoY	30.0%	50.0%	10.0%
FY2027–2030 growth	20%, 16%, 12%, 10%	28%, 24%, 20%, 16%	10%, 8%, 6%, 4%
Gross margin	63.0%	65.0%	60.0%
OpEx / revenue	19.0%	18.0%	22.0%
Operating tax rate	22.0%	22.0%	22.0%
D&A / revenue	0.9%	0.9%	0.9%
PP&E / revenue	2.5%	2.5%	3.0%
Extra intangible budget / revenue	0.5%	0.5%	0.5%
Year-end NWC / annual revenue	9.0%	8.0%	11.0%
WACC	10.0%	9.0%	12.0%
Terminal growth	3.0%	3.5%	2.0%

Calibration judgment

Derived historical gross margins span approximately 61.95–64.56%; D&A/revenue spans 0.75–1.20% across available annual/interim periods. These are discussion ranges, not forecast confidence intervals. Reported effective taxes vary approximately 12.65–20.81%, but do not validate a normalized 22% EBIT tax rate. No filing supports the particular multiyear growth, WACC or terminal-growth choices. [K pp.69,72; Q pp.2,5; R2 and assumption_evidence_matrix.csv]

Forecast construction and FCFF methodology

Base annual forecast: HYPOTHETICAL / NOT YET VALIDATED

FY2026 is a partial-year estimate: 9M income, D&A and PP&E purchases are reported; Q4 is modeled. Annual operating taxes, intangible investment and economic NWC are modeled. FY2027–FY2030 are entirely estimates. Values below are rounded for presentation, not independently entered. [R1; model_outputs/forecasts.csv]

USD millions / %	FY2026E	FY2027E	FY2028E	FY2029E	FY2030E
Revenue	12,636.4	15,163.7	17,589.9	19,700.7	21,670.8
Revenue growth	40.3%	20.0%	16.0%	12.0%	10.0%
Gross margin	62.9%	63.0%	63.0%	63.0%	63.0%
Operating expenses	2,349.1	2,881.1	3,342.1	3,743.1	4,117.4
Operating income / EBIT	5,601.2	6,672.0	7,739.6	8,668.3	9,535.1
Operating margin	44.3%	44.0%	44.0%	44.0%	44.0%
Modeled taxes	1,232.3	1,467.8	1,702.7	1,907.0	2,097.7
NOPAT	4,369.0	5,204.2	6,036.9	6,761.3	7,437.4
D&A	99.4	136.5	158.3	177.3	195.0
PP&E purchases	265.8	379.1	439.7	492.5	541.8
Extra intangible budget	63.2	75.8	87.9	98.5	108.4
Change in NWC proxy	869.8	227.5	218.4	190.0	177.3
Full-year modeled FCFF	3,269.6	4,658.3	5,449.1	6,157.6	6,805.0
DCF-included FCFF	956.1	4,658.3	5,449.1	6,157.6	6,805.0

Explicit forecast mechanics

FY2026 revenue = reported 9M2026 + derived Q4 FY2025 revenue × (1 + assumed Q4 growth). Q4 FY2025 revenue of 2,487.8 is FY2025 less 9M2025, not a separately reported line. Later years use scenario growth. EBIT (operating income) = gross profit − OpEx; NOPAT (after-tax operating profit) = EBIT − modeled taxes. [K p.69; Q p.2; R1]

FCFF = EBIT × (1 − tax rate) + D&A − CapEx − change in operating NWC. No interest expense or dividend is subtracted. No SBC add-back or arbitrary repurchase outflow is added: compensation remains an operating cost. Existing awards still require a separate dilution/claim assessment to avoid double charging future service costs. [R1–R2]

Timing and classification audit

Only Q4 FY2026 FCFF enters the DCF at 0.25 years; FY2027–FY2030 use 1.25–4.25 years. Full-year FY2026 FCFF is not discounted in addition. Annual modeled FCFF less elapsed-9M modeled FCFF reconciles to the Q4 stub in all three cases. Elapsed-9M normalized taxes/intangibles/NWC are modeled, not reported FCFF. [R2; stub_audit.csv]

The current-only NWC proxy rises from 267.5 at December 2025 to 1,051.3 at September 2026. Including noncurrent deferred revenue changes the increase from 783.8 to 416.3. Neither is economically validated; reclassification requires recalibrated targets, not a one-time cash release. [Q p.1; R2; nwc_classifications.csv]

Annual combined purchases lack a reliable split. The model adds a hypothetical 0.5%-of-revenue intangible budget; a separate PP&E-only alternative omits it to isolate its effect. That alternative is incomplete if intangibles are needed, not evidence of zero actual spending or a validated upper bound. [R2; capex_alternatives.csv]

Scenario enterprise valuation and sensitivity

HYPOTHETICAL / NOT YET VALIDATED • USD millions • September 30, 2026 retrospective reference

Case	WACC	Terminal g	Enterprise value	Terminal PV / EV
Base	10.0%	3.0%	86,484.9	78.6%
Bull	9.0%	3.5%	154,717.2	83.9%
Bear	12.0%	2.0%	38,671.0	69.5%

Enterprise value = sum of discounted forecast FCFF + discounted terminal value. Terminal value = next-year terminal FCFF / (WACC − terminal growth); WACC must exceed terminal growth. Terminal FCFF recomputes NOPAT, D&A, CapEx and NWC investment rather than merely growing the last FCFF. These are operating-asset values, not market capitalizations or equity valuations. [R1; scenario_dcf.csv]

Base operating case: WACC versus terminal growth

WACC / g	2.0%	2.5%	3.0%	3.5%	4.0%
8.0%	104,569.5	112,637.2	122,318.4	134,151.0	148,941.7
9.0%	89,132.8	94,797.7	101,406.7	109,217.3	118,590.1
10.0%	77,570.0	81,730.3	86,484.9	91,971.0	98,371.4
11.0%	68,589.3	71,750.2	75,306.3	79,336.5	83,942.4
12.0%	61,415.4	63,882.0	66,622.6	69,685.7	73,131.6

Sensitivity values are enterprise values in USD millions. Only WACC and terminal growth change within this Base grid; operating assumptions remain fixed. Cross-scenario differences above also change growth, margins and reinvestment. The grid is not a probability distribution, price target range or market-implied valuation. [R1; sensitivity.csv]

Terminal economics and valuation dependence

Case	Net reinvestment / NOPAT	Implied incremental return
Base	6.9%	43.6%
Bull	6.5%	54.1%
Bear	9.5%	21.1%

The implied incremental return equals terminal growth / (net reinvestment / NOPAT), with net reinvestment = CapEx − D&A + change in NWC. It is not reported accounting ROIC. These high implied returns require validation; terminal growth and reinvestment are not independent free inputs. Terminal value represents roughly 69–84% of modeled EV across the cases, making mature economics particularly important. [R2; terminal_economics.csv; scenario_dcf.csv]

Original scenario EVs are unchanged. WACC and terminal economics still require evidence. Separate CapEx-scope alternatives isolate a modeling choice rather than establish a recommended valuation range. [R2; U]

Peer comparison and valuation cross-check

Peer selection and operating context

Cisco is a direct networking competitor; NVIDIA supplies competing networking/platform architectures. Neither consolidated group is a pure-play equivalent to Arista. Cisco includes broader software/security/services; NVIDIA includes compute and other businesses. These are qualified comparisons, not a claim that either peer's consolidated multiple should apply to ANET. [K, Item 1 pp.8–9; N, Item 1 p.5; C, Item 1; U]

Company / FY end	Revenue	Own FY YoY	GAAP op. margin
ANET / 2025-12-31	9,005.7	28.6%	42.8%
CSCO / 2026-07-25	63,325.0	11.8%	24.3%
NVDA / 2026-01-25	215,938.0	65.5%	60.4%

Revenue and EBIT are reported; growth and operating margin are analyst-derived. All amounts are USD millions. Period ends differ: these are own-fiscal-year observations, not calendarized TTM comparisons or a rank of networking segment profitability. No direct valuation premium or discount is inferred. [K p.69; C p.57; N p.51]

Trading multiples: required evidence

Metric	Status / evidence needed
EV / Revenue	Unavailable: common-date peer market EV and calendarized TTM revenue required.
EV / EBITDA	Unavailable: EV bridge plus aligned EBIT and pure D&A definition required.
Forward P/E	Unavailable: reliable dated NTM diluted EPS and price/period alignment required.
Growth / operating margin	Available only as own-fiscal-year historical context above.

A quantitative DCF peer cross-check is unavailable with the current inputs. A common-date market capitalization requires sourced prices and an appropriate dated share schedule; EV then requires consistently classified cash and claims. Calendarize financials and reconcile GAAP EBIT, pure D&A, SBC and acquisition effects before comparing EBITDA. Cisco's cash-flow depreciation/amortization/other line is not automatically pure D&A. [C, cash flows p.59; U]

The table supplies operating context, not a relative-value conclusion. Hypothetical ANET DCF EV is not a market trading EV; peer valuations cannot yet corroborate it. A numerical cross-check requires the missing dated market and forward-earnings inputs. [U; docs/peer_valuation.md]

Thesis monitoring and twelve-month framework

Research debate and potential variant perception

Analyst hypothesis: headline growth and low historical combined cash purchases may overstate sustainable cash conversion if deferred-cost balances and reinvestment rise. Counter-case: scale improves operating efficiency while deferred revenue funds operations. This is a proposed debate, not a finding about consensus: no dated consensus dataset was obtained. [Q pp.5,9,18–19; U]

Monitoring test	What would weaken the thesis
Accepted deployments / customer mix	Spending reprioritization, acceptance delays or concentration-driven volatility. [K p.7; Q pp.14–15]
Renewals / customer economics	Weak independent evidence of software benefits; procurement bundling or rival architectures. [K pp.6–9; N p.5]
Matched-period margins / cash flow	Persistent gross-margin pressure or deferred-cost / inventory absorption without cash conversion. [Q pp.5,9,16,18–19]

Reference price, fair value and twelve-month target

The verified reference close is USD 170.80/share on November 6, 2026, at 16:00 America/New_York (EST), the latest completed session before the research date. Stock Analysis and ChartExchange historical tables corroborate it; this is vendor verification, not exchange-feed certification. Their September 30 close of USD 203.59/share is separate, same-date dilution context. Neither price establishes fair value. [M; U]

A November 8, 2027 twelve-month target requires horizon-specific remaining FCFF, cash/distributions, claims and diluted shares. September 30 retrospective EV cannot be treated as November equity fair value or rolled into an equity target at WACC. The available reference close supplies the return denominator; the supported target numerator is still missing. [U]

Transparent rating discipline — NOT RATED

With supported valuation inputs and explicitly documented analyst-policy thresholds: Buy above the buy return hurdle; Sell below the sell hurdle; Hold between them, including boundaries. Price return = supported twelve-month target / dated reference close − 1; total return also requires distributions. No arbitrary numeric cutoffs are assigned. Thresholds and all economic evidence gates must be satisfied before a rating; NOT RATED is not Hold. [U; docs/price_target_framework.md]

Conclusion: operating performance warrants further research; a price-based investment conclusion requires evidence-supported forecasts and a complete equity valuation. Retain NOT RATED until those conditions are met. [U]

Limitations, sources and reproducibility

Unresolved equity bridge and diluted-share inputs

Reported September 30, 2026 cash is 2,288.1 and securities are 12,070.9; their 14,359.0 sum is not automatically excess liquidity. The 905.2 cash-equivalent investment subset is already within cash. Restricted cash of 1.5 sits outside this pool in other assets. Operating reserves, realization/restriction adjustments and eligible nonoperating assets remain unresolved. [Q, Item 1 p.1; Note 2 pp.7–8; R2]

No separately disclosed funded borrowing is a limited classification, not proof of zero debt-like claims. Other current liabilities of 296.4 and long-term liabilities of 358.1 need operating/tax/debt-like classification. Other assets of 899.2 are not a validated nonoperating addition. Preferred/NCI zero components do not establish zero aggregate claims. Rent remains in EBIT; lease capitalization would require coordinated FCFF and WACC treatment. Avoid deducting operating liabilities in both NWC and the bridge. [Q pp.1,6; K Note 5 p.86; R2]

September basic shares of 1,263.4 million and unvested RSUs of 24.3 million do not establish fully diluted shares. Q3/9M diluted EPS shares of 1,278.2/1,276.0 million are period averages. Award terms, vesting, proceeds and a dated economic dilution method remain unvalidated. Together, these bridge and dilution gaps keep equity/per-share outputs BLOCKED. The USD 170.80 dated reference close is verified and available (page 9); the valuation inputs are incomplete. [Q pp.1,4; Notes 5–6 pp.11–12; R2]

Reproducibility and remaining research

Editable source: reports/anet_integrated_research.md. Run the valuation module, integrated schedule module and scripts/build_integrated_report.py, then pytest. Install requirements-report.txt for PDF validation. Input-hash manifests, bridge ledger, dilution schedule, assumption matrix, peer table and readiness gates are included. The prior eight-page report is archived unchanged. Builds are offline. [U]

This upgrade rechecked 24 annual and eight interim figures directly against official SEC HTML; all match the preserved CSVs. Other historical checks reuse existing snapshots; this is a scoped review, not an independent audit. Source page numbers are filing printed pages; K local PDF pages are printed page +4. Full FY2023 balance-sheet data is unavailable; interim cash flow is YTD only. Independent competitive economics, AI revenue attribution and defensible forward driver/WACC/dilution evidence remain open. No unsupported TTM FCF or TTM diluted EPS is calculated. Research conclusion: NOT RATED; unresolved economic and equity inputs preclude a price-based recommendation. [R1–R4]
